

Create network setup and configuration

QUESTIONS

1. Hands on Task:
Configure 2 Virtual Machines with static IP addresses 10.10.0.5 and 10.10.0.6, establish connectivity between the systems by checking if they can ping each other or not.
2. What command is used to disable the network service at boot time?
3. Can we add multiple IP Addresses to the same system? (Assume that system has 2 network interfaces). Try to do this and find out.
